Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; 88.
                                                                                                                     The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                    preventing allergy or asthma using an immunostimulatory one or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterchaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune disease, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is that of the target sequence #8 which was used in an experiment to determine the in vitro cleavage of target duplexes to evaluate the lengths of purine and pyrimidine tracts which are useful in obtaining oligonucleotides capable of triple helix formation with target nucleic acids. The complementary strand overhangs the 3' end by the sequence CTAG and the sense strand overhangs the complementary strand by the sequence AATT. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligo:nucleotide(s) forming triple helix with target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              contain purine and pyrimidine tracts in specific orientations, useful therapeutically or diagnostically e.g. for inactivating HIV RNA, etc.
                                                                                                                                                                                                                                                                                                                                       ö

Other claimed primers (see AATB4420-27) are used to detect a duplication of the KIT gene. The 3 allelses for cac colour (1, inhibition of coat colour, 1(p), patch, and i, development of colour) can be differentiated on the basis of duplication/deletion in the KIT gene. This allows breeding of pigs with

neuroepithelial stem calls, which are capable of self-renewal in adherent feeder-cell-independent (AFCI) culture medium and differentiation to central nervous system (CNS) neuronal or glial cells and to neuronal crest stem calls. Also described is an isolated population of mammalian CNS glial-restricted precursor (GRP) cells which can self-renew in the AFCI culture medium and can differentiate to CNS glial cells but not to CNS neuronal cells. The stem cells can be used to generate a population of mammalian motor neurons by incubating the stem cells by incubating the stem cells of mammalian motor neurons by incubating the stem cells in a medium comprises laminin-coated plates and NEP medium lacking chick embryo extract. The stem cells can also produce neural crest stem cells by inducing the cells on differentiate in vitro. The inducing step comprises comprises antioned mitogen (preferably fibroblast growth factor; FGF) and chick embryo extract. Inducing can also comprise adding a dorsalizing agent to the cells, preferably a bone morphogenetic protein (BMP) such as BMP-2, -4 or -7. The stem cells and inducing the stem cells of the corrier of the cells of the cells on a laminin-coated by stem cells to differentiate in vitro to neural crest stem cells, and inducing these cells to differentiate. AAX00039 to AAX00034 represent PCR primers which are used in an example from the present invention to amplify different FGF and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated, pure population of mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mammalian neuroepithelial stem cells and glial restricted precursor - car
self renew and differentiate into central nervous system cells, used for
generating various types of cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      products according to breed origin; (b) determining or testing the breed origin; (b) determining or testing the breed origin; (c) relidating an animal product. The method contign of a product a sample of the product for the allele(s) of at least comprises analysing a sample of the product for the allele(s) of at least one breed-determinant (BD) gene. The present invention also describes: (1) methods for determining the coat colour genotype of a pig by determining; (i) the allele(s) of the alpha melanocyte-stimulating confidence of the protein at positions associated with coat colour, or the size of the alpha-MSHR protein; (ii) the amino acid sequence of an alpha-MSHR protein; (iii) detecting which microsatellites (or other linked marker alleles), linked to the alpha-MSHR gene, or particular alleles of it, are present; and (iv) analysing nucleic acid to determine if the KIT care present; and (iv) analysing nucleic acid to determine if the KIT method of the invention is applied to samples from fish, birds and manmals, especially pigs. Particular applications are confirming stated origin of meats; in quality control; for maintaining stock purity, and in the present process can be made quantitative. The present sequence inexpensively. The process can be made quantitative. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Differentiating products from different animal breeds - by the analysis of alleles of breed-determinant genes, at the nucleic acid or protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Neuroepithelial stem cell; lineage restricted intermediate precursor; oligodendrocyte; astrocyte; self-renewal; neuron; differentiation;

                                                                                                                                                                                                                                                                                                                                                                                   The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ98483-514 represent sequences from Hallotis discus, used in the method
                                                                                                                                                                                                                                                                                                     Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           alpha-2 macroglobulin-like polypeptide variant;

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the gecification. A polypeptide of the invention has antidiabetic.

C anorectic, cardiant, Mypotensive, antiatreriosclerotic, anorectic, anorectic, antiatation. Hypotensive, antiatreriosclerotic, anorectic, antiatation, fungicide, protozoacide, nootropic.

C antilipamatory, dermatological, antiasthmatic, and antilpodies antiatreriotic, antiatrerior, antiparkinsonian, anticonvulsant, osteopathic, antilatematory. The polypeptides, nucleic acid molecules and antibodies in gene therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

C are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases (wiral, bacterial, fungal, dispetens), and protozoal), anorexia, cancer, cardiavascular diseases (wiral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiavascular diseases (costeoarthritis) hematopoletic disorders, inflammatory skin disorders, cathma, and various dyslipidaemias. The nucleic acids and polypeptides for the identification of small molecules may also be used as targets for the identification of small molecules proliferation, haematopolesis, wound healing and anglogenesis, in generation of antibodies that bind immunospecifically of proliferation, haematopolesis, wound healing and expenses for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, completens NOVIA-1 tehow homology to complement factor I precursor; NOVA shows homology to matrix metalloproteinser, and pharmacogenomics. The procusor; NOVA show homology to alpha-2 macroglobulin-li
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transmembrane protein-like, NOV12a-12c show homology to beta-neoendorphin-dynorphin precursor. The present sequence represents a probe used in the
                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections
                                                                                                                                                                                                                                                                                                                                    Padigaru M, Rieger DK;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring or family members of a gene and a cross-species comparison. Each of the nucleic acide further comprises at ag sequence. The array of nucleic acide for probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of many has hear has been been and a cross-species comparises by primer extensions or in screening content of the primer extensions or in screening content or probes and the sequence or specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human microarray DNA oligonucleotide SEQ ID NO 80269.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 25 BP; 3 A; 8 C; 9 G; 5 T; 0 U; 0 Other;

The invention relates to a method for stimulating a population of stem cells to differentiate into osteoblast cells by contacting the population with an agent which increases fibroblast growth factor receptor 3 (FGFR3) expression or activity, where increase in FGFR3 protein expression or activity, where increase in FGFR3 protein expression or activity results in differentiation of the stem cells into osteoblast cells. The method is useful for stimulating the population of stem cells increases bone density. The method is useful for accening the agent increases bone density, or ameliorates the effects of osteoporosis. The method is useful for diagnosing a condition characterised by abnormal stem cell differentiation, bone density or rate of osteoblast formation and treating a patient with a condition characterised by an abnormal rate of osteoblast formation condition characterised by an abnormal rate of osteoblast formation of seteblast formation of seteblast formation, bone density or osteoporosis. The sequence is a RT-PCR primer used for human FGFR3 expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Stimulating a population of stem cells to differentiate into osteoblast cells useful for treating osteoporosis, by contacting the cells with agent which increases fibroblast growth receptor 3 expression or

The invention relates to a method for stimulating a population of stem cells to differentiate into osteoblast cells by contacting the population with an agent which increases fibroblast growth factor receptor 3 (FGFR3) expression or activity, where increase in FGFR3 protein expression or activity results in differentiation of the stem cells into osteoblast cells. The method is useful for stimulating the population of stem cells to differentiate into osteoblast cells. The method is useful for screening the agent increases bone density. The method is useful for screening the agent threases bone density, or ameliorates the effects of osteoporosis. The method is useful for diagnosing a condition characterised by abnormal stem cell differentiation, bone density or rate of osteoblast formation and treating a patient with a condition characterised by an abnormal rate of osteoblast formation, bone density or osteoblast. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Stimulating a population of stem cells to differentiate into osteoblast cells useful for treating osteoporosis, by contacting the cells with agent which increases fibroblast growth receptor 3 expression or

has a tumour cell or site of anglogenesis, or if a treatment is effective in changing angiogenesis or changing a status of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of siglec in a cell. Peripheral blood monouclear cell (PBMC)-expressed Keratin 14, TIE 1, Salioadhesin or Siglec, and kits containing them from the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. ABQ82006 represent nucleotide sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           marker gene; tumour; Kaposi's Sarcoma; peripheral blood mononuclear cell; PBMC; expressed keratin 14; TIE 1; Salioadhesin; Siglec 1; anglogenesis; drug target; tag; SAGE library; KS3; KS4; PCR; primer; ss.

The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment; and determining whether the sample comprises an expression product of at least one marker gene. The marker gene and a proteinaceous molecule (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononuclear cell (PBMC) expressed Keratin 14, TIE 1, Salioadhesin, or Siglec 1 sequences or a fully defined sequence given in the specification, or their analogues are useful as indicators for angiogenesis and for their analogues are useful as indicators for angiogenesis and for checting the presence of a tumour cell in an individual. The expression product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This

The present invention describes a method for the inspection of flat epithelial cells in which it is judged that flat epithelial cells epithelial cells in which it is judged that flat epithelial cancer when the separated from an organism can proceed to flat epithelial cancer when the case in fibroblast growth factor receptor (FGFR) gene of the cells is mutated from guanine to thymine. Also described is a method for coreaning treating or preventive agents for flat epithelial cancers in which a candidate substance of treating agent for flat epithelial cancer is applied to flat epithelial cancer cells producing FGFR protein in which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from guanine to thymine or the 697th amino acid is mutated from glycine to cysteine and said candidate substance is selected by using the facts that the 2128th base in the flat epithelial cell FGFR3 gene after the application returned to glycine as the indices. The method is used for the inspection of flat epithelial cells. The present sequence Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer. inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer. represents a PCR primer for human FGFR3, which is used in an example from Human, fibroblast growth factor 3; FGF3; flat epithelial cell; cancer; flat epithelial cell cancer; PCR primer; 88. The present invention describes a method for the inspection of flat
epithelial cells in which it is judged that flat epithelial cells
separated from an organism can proceed to flat epithelial cancer when the
separated from an organism can proceed to flat epithelial cancer when the
constant pass in fibroblast growth factor receptor (FGFR) gene of the cells
is mutated from guanine to thymine. Also described is a method for
constant cancers in
constant cancers in
constant cancers in
constant constant cancer cells producing FGFR protein in
which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from
constants to thymine or the 697th amino acid is mutated from glycine to
constant cancers and said candidate substantes is selected by using the facts that
constant cancer and said candidate substantes is selected by using the facts that
constant cancer cancer cells FGFR3 gene after the
constant cancer and that the 697th amino acid of FGFR3
constant cancer and the flat epithelial cell FGFR3 gene after the
constant cancer cells produced of FGFR3
constant cancer cells produced of FGFR3
constant cancer cells produced of FGFR3
constant cancer cells

15-AUG-2002;

The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cycosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotocxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.

Sequence 19 BP; 7 A; 8 C; 1 G; 3 T; 0 U; 0 Other;

WPI; 2003-812539/76.

New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer or for chromosome mapping.

            This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                                                                                                                Gaps

The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3 'terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cyclosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cyclocoxicity. The method is used for designing and synchesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       detection; RNA interference; siRNA; gene silencing; gene expression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting sequence of RNA interference useful for synthesizing siRNA, by

The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is
                                                                                                                                                                           The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is quanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; detection; RNA interference; siRNA; gene silencing; gene expression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes MNA interference without showing cytotoxicity. The method is used for designing and synthesizing shRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; detection; RNA interference; siRNA; gene silencing; gene expression;
                                                                                                                                                                                                                                                                                                               Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is guanine or cytosine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides

siRNA and a second optimised siRNA. The method is useful in selecting siRNA for generating a gene silencing reagent. The present sequence is used in the exemplification of the invention. The sequence is shown in

used in the exemplification of the invention. The sequence is shown in the specification as DNA, but described as siRNA.

The invention relates to a novel method for selecting siRNA (short interfering RNA) comprising selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of sequences of 19-25 nucleotides in length that are substantially complementary to a stretch of nucleotides of the target sequence, where the functionality is dependent upon non-target specific sequence, where the functionality is dependent upon non-target specific sequence; where the functionality is dependent upon non-target specific sirana also claimed are methods for gene-silencing, developing an sirana algorithm for selecting sirana, selecting an sirana with improved functionality, selecting hyperfunctional sirana, a sirana molecule comprises a sequence substantially similar to sirana. The sirana molecule compress a sequence substantially similar to sirana. The sirana of GAGAGUUGGUUGAUU, GAAGUAGUGAUU,

The present invention describes using a leukotriene synthesis inhibitor

(I) for the manufacture of a medicament for the treatment of myocardial infraction in an individual.

Also described is a method (MI) for the treatment of acute coronary

Also described is a method (MI) for the treatment of acute coronary

antiatherosclerotic, cardiant and antianginal activities, and can be used

as a leukotriene biosynthesis inhibitor, and a leukotriene receptor

antiatherosclerotic, cardiant and antianginal activities, and can be used

as a leukotriene biosynthesis inhibitor, and a leukotriene receptor

cantagonist. (I) can be use for the manufacture of a medicament for the

treatment of myocardial infarction or susceptibility to myocardial

infarction in an individual who has at least one risk factor chosen from

an at-risk haplotype for myocardial infarction, an at-risk haplotype in

the 5-lipoxygenase activating protein (FLAP) gene, a polymorphism in a

cc flap nucleic acid and an at-risk polymorphism in the 5-lipoxygenase (5-

CD) gene promoter; in an individual who has at least one risk factor

chosen from diabetes, hypertension, hypercholesterolaemia, elevated

chosen from diabetes, hypertension, hypercholesterolaemia, elevated

inflammatory marker chosen from Creactive protein (CRP), serum amyloid

A, fibrinogen, leukotriene, leukotriene metabolite, interleukin-6, tissue

necrosis factor-alpha, soluble vascular cell adhesion molecule (sVCAM),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            leukotriene synthesis inhibitor; myocardial infarction; antianginal; acute coronary syndrome; antiatherosclerotic; cardiant; antianginal; leukotriene biosynthesis inhibitor; leukotriene receptor antagonist; 5-lipoxygenase activating protein; FiAP; human; chromosome 13; chromosome 134; polymorphism; 5-lipoxygenase gene promoter; 5-LO gene promoter; diabetes; hypertension; hyporrohiserscholesterolaemia; obesity; inflammatory marker; low density lipoprotein; cholesterol; high density lipoprotein; angina; atherosclerosis; microsatellite marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of leukotriene synthesis inhibitor for manufacture of a medicament for treatment for myocardial infarction or susceptibility to myocardial infarction in individual.

RESULT 454 AAF63628/

```
The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MboI DNA fragments of between 250 and 500

CC clones cross-hybridised. Assuming independent distribution of 500

CC clones cross-hybridised. Assuming independent distribution of 500

CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100, 000. The sequence information

CC for ca. 210 such bovine microsatellites is summarised in the

Specification and indexed herein (see below). The sequences upstream and

CC specification and indexed herein (see below). The sequences upstream and

CC downstream of the microsatellite sequence waset to generate the

microsatellite (using the program OPTIPRIM). The microsatellites may be

CC used to identify individuals, for parentage testing, and in the genetic

CC used to identify important traits esp. in cattle, to allow selective

CC connomically important traits esp. in cattle, to allow selective
                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The present invention describes a method for the production of isogenic transgenic plant lines (A) by transforming cells of a hybrid with T-DNA transgenic plant lines (A) by transforming cells of a hybrid with T-DNA vector containing a transgene (I), the hybrid being derived by crossing a vector containing a transgene (I), the hybrid being derived by crossing a containing transformation (LT).

Inc of interest (LI) and a line suitable for transformation (LT) in the products only, then back-crossed with LI and selection of T-DNA into the LI cenome only, then back-crossed with LI and selection of products until contained. The method is used for introgenession of several cransgenic characteristics into a plant. (I) may express an antisense transgenic characteristics into a plant. (I) may express an antisense cond/or improves some agronomic or nutritional property. By selecting primary transformatts, the method allows introduction of genes without confinence in it makes possible production of truly isotransgenic lines which (I) can be transferred to a plant genome is increased, since the which (I) can be transferred to a plant genome is increased for mumber of backcrossings required is reduced and the genetic sources for moduction of commercial hybrids is significantly broadened. The present sequence (I,e, a GSPLB oligonucleotide) in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      production of transgenic plant lines, useful for producing elite hybrids with transgenic characteristics, includes selection for incorporation of transgene into particular parent.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comnstream of the microsatellite sequence waset to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
conomically important traits esp. in cattle, to allow selective
bredging. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neuroepithelial stem cell; lineage restricted intermediate precursor; oligodendroyte; astrocyte; self-renemal; neuron; differentiation; neural crest cell; fibroblast growth factor; FGF; FGFR; receptor; CNS central nervous system; glial cell; PCR primer; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (ACI)5 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information converted the microsatellite sequence were used to generate the required for prince for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by a large one allele by insertion, of a promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter, (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells maying both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal adent, an antifungal agent that inhibits the growth of a fungus to an antifungal and for identifying a therapeutic agent for treatment of a mammalian disasse. (MI) is useful for identifying a compound which modulates the cativity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, biosynthetic, transporter, transcriptional, cativity. The method is useful for identifying a compound having the cativity. The method is useful for identifying a compound having the cativity of inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a per primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based or perfect this patent is not represented in the printed specification but is based or construction.
                                                                                                                                                                                                                      Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ASTH1 locus; ASTH11; ASTH1J; human; chromosome 11p; asthma; bronchial hyperreactivity; ets family; transcription factor; splice variant; genetic predisposition; polymorphism; antibody; drug screening; prophylaxis; therapy; diagnosis; single nucleotide polymorphism; SNP; ss.

New set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes, useful for genotyping diverse genomes of plant and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.
                                                                           repeat; ISSR; SSR; PCR; primer; genotyping; plant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH1I and ASTH1I ocus, which are suscitated with a genetic predaposition to asthma and bronchial hyperreactivity. The ASTH1I locus, and have similar patterns of expression and common sequence motifs. They are both expressed in trachea, lung and adered of transcription factors, which have been implicated in the est family of transcription factors, which have been implicated in the activation of a variety of genes including the TCRs gene and cytckine genes known to be important in the actiology of asthma. Both ASTH1I and ASTH1I mand ASTH1I mand ASTH1I mand ASTH1I mand ASTH1I will as a variety of genes including the TCRs gene and cytckine crowns involved are all 5' to the start codon in exon b. In contrast, alternative splicing of ASTH1I transcripts results in 3 different ASTH1I incled are all 5' to the start codon in exon b. In contrast, attending a series are useful as diagnostics to identifying ASTH1 related genes, for identifying expression of the gene in a biological specific gene modifications in cell lines. The encoded ASTH1 proteins are useful as immunogens to raise specific antibodies; in drug screening for compositions that minic or modulate activity or expression of ASTH1I and as a therapeutic. The ASTH1 genes or fragments thereof, encoded proteins, and charapeutic additional in the identification of individuals predisposed to development of aethma, and for modulation of gene activity in vivo for prophylactic and therapeutic purposes. The intact ASTH1I and and ASTH1I contrast. ASTH1I and the identification of individuals predise proteins or active fragments thereof may be used to modulate or reduce bronchal hyperreactivity, sequences. The intact ASTH1I and AMAB0264-AB0416 contrast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids other than naturally occurring chromosomes encoding ASTH1 protein. for e.g. screening compositions that modulate expression or function of ASTH1 proteins or as diagnostics for genetic predisposition to asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       463
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                             nucleoside subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The closed action with a target nucleic acid molecule. The oligodeoxyribonucleotides has a sequence of nucleoside subunits effective to form a duplex with a target nucleic acid molecule. The oligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3'-P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytcoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation disorders, inflammatory processes, certain genetic disorders, cancers, etc. . The present sequence represents an oligonucleotide of the invention

The specification describes oligodeoxyribonucleotides having contiguous uncleoside subunits are joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The oligodeoxyribonucleotides has a sequence of nucleoside subunits effective consignation with a target nucleic acid molecule. The coligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3'-P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity. They may be used in diagnostic and therapeutic cytcoxicity in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation disorders, inflammatory processes, certain genetic disorders, cancers, etc. The present sequence represents an oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                          Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Prostate cancer; human; marker; diagnosis; treatment; RT-PCR primer; ss.

This primer is used in the relative quantitative RT-PCR to examine the expression of the genes which is used for the identification of markers of human prostate cancer. Isolated nucleic acid segments shown in AAV16881 to AAV16885, AAV16890 to AAV16903, AAV26351 and AAV26352 which can act as human prostate cancer markers are provided in the specification. The specification also provides methods for identifying markers for human prostate cancer and for detection of prostate cancer calls. The markers can be identified by amplifying human prostate RNA to provide nucleic acid amplification products, separating the products and identifying those RNA that are differentially expressed between human cells in a sample can be detected by detecting a nucleic acid in a sample, the nucleic acid being a prostate cancer marker. Primers and probes derived from this marker can be used for the detection of prostate cancer calls in a sample. Antibodies against the protein encoded by the marker nucleic acid fragments, inhibitors of the protein and olygonucleotides antisense to the markers can be used for the diagnosis of prostate cancer.
Human prostate cancer marker - useful for detection and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 24 BP; 11 A; 10 C; 2 G; 1 T; 0 U; 0 Other;

Diagnosing prostate cancer and benign prostatic hyperplasia cells - using oligonuclectide probes specific for marker genes associated with tumor differentiation and progression in Reverse Transcription Polymerase Chain Reaction analysis.

Example 4; Col 66; 74pp; English

```
The invention provides nucleic acid markers of prostate, breast and bladder cancer. The markers are indicators of malignant transformation of prostate, breast and bladder tissues and are diagnostic of the potential for metastatic spread of malignant prostate tumours. The nucleic acid can also be used as targets for therapeutic intervention in prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer. The markers may be used to design specific probes and primers, for the rapid analysis of prostate, bladder or breast biopsy samples. The probes and primers may also be used for in situ hybridization or in situ PCR detection and diagnosis. They may also be used to identify and isolate till length gene sequences form various DNA libraries. Antibodies against the polypeptide products of the markers can be used to treat prostate cancer. Ladder cancer or breast cancer. The encoded proteins may be used to detect antibodies. The proteins and antibodies can be used in munondetection methods for detecting or quantifying the cancers, and for
               The invention relates to methods for diagnosing prostate cancer or benign prostatic hyperplasia cells in a biological sample. The method uses oligomucleotides specific for marker genes associated with tumour differentiation and progression in Reverse Transcription Polymerase Chain Reaction (RT-PCR) analysis. The methods are diagnossic techniques useful for detecting and monitoring the progression of benign prostatic hyperplasia and human prostate cancer (the most prevalent form of cancer and a major cause of death in males) prior to the tumor undergoing metacasis, therefore allowing the optimal method of treatment to be determined before the condition becomes life threatening
                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid marker; biomarker; tumour; prostate cancer; bladder cancer; benign prostatic hyperplasia; BPH; breast cancer; human; immunodetection; diagnosis; PCR primer; ss.

The sequence represents nucleic acid biomarker UC band 210 primer #1, used in detection of prostate, breast and bladder cancer. Biomarker nucleic acid sequences can be used as hybridisation probes and primers that specifically hybridise to prostate cancer, benign prostatic hyperplasia (BPH), bladder cancer or breast cancer markers. Proteins encoded by the nucleic acid markers can be used to produce antibodies for the detection of prostate, breast or bladder cancer. The nucleic acids can be used as targets for therapeutic intervention in these diseases, in the identification and isolation of full-length gene sequences, including libraries, as hybridisation probes for screening genomic human DNA libraries. The ktts comprising the nucleic acid sequences are useful for detecting bladder, breast or prostate cancer cells in a biological sample
                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acids as biomarkers and targets useful for detecting, diagnosing, prognosing, and in developing treatments for prostate, breast and bladder cancer.
clinical diagnosis of these cancers. The antibodies may also be used for radioimaging to quantify and localize the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                     Biomarker UC band 210 primer #1 used in diagnosis/prognosis of cancer.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CC Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Sector for comparison levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison.

CC remily members of a gene and a cross-species comparison.

CC remily method in in situ hybridisation, in Southern, Northern or dotprobes is useful in in situ hybridisation, in Southern, Northern or dotpropression so fany gene, in mapping the 5' termini of mRNA molecules by primer extensions of any gene, in mapping the 5' termini of mRNA molecules by crimer extensions or in screening solwh or genomic libraries or subclones containing segments of DNA that have been contained probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly crow in sequence. The sequence contains of any end in electronic format directly contained in electronic format directly the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are altached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening segments of DNA that have been containing segments of DNA that have been containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly from USPTO at sequence.html

The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Williams syndrome cognitive profile; WSCP; cognition; LIM-kinase 1; LIMK1 gene; supra-vascular aortic stenosis; protein kinase; human; PCR;

                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                       This oligonucleotide was designed to amplify the region of homology in the kinase domains of PDGF receptor, HER2, HER3, FGF-FLG, FGF-BEK, insulin receptor and IRR. It was used with another kinase homology domain-based primer (see AAV05314) in the amplification of human LIM-kinase 1 (LIMK1) sequences. The LIMK1 gene is composed of 16 exons (see AAV05315 and AAY99599-T99629) and is located 15.4 kb 3' of elsethin in chromosome 7. It encodes a novel protein kinase (see AAW6576). Williams syndrome cognitive profile (WSCP) is detected by determining zygosity of the LIMK1 locus, with hemizygosity being indicative of impaired visuo-spatial constructive cognition. Chromosome 7 deletion analysis allows discrimination between WSCP, SVAS (supra-vascular aortic stenosis) and Williams syndrome
                                                                                                                        Diagnosing Williams syndrome cognitive profile from hemi-zygosity of LIMX1 - gene on chromosome 7 encoding new kinase, allowing differentiation from classic Williams syndrome and supra-vascular aortic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ZAP-70; Zeta chain-associated protein; treatment; prevention; disease; immunosuppressor; cancer; PCR primer; ss.

The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or bobring pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence repersents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                       AAV73860-V73865 are PCR primers used in the amplification of a mammalian zeta chain-associated protein, ZAP-70. This protein can be used for the prevention and the treatment of illnesses having an immunosuppressive component such as cancer and infectious diseases. (Updated on 27-AUG-2003
Immune activator comprising membrane-localised ZAP-70 - useful for the prevention and the treatment of conditions exhibiting immunosuppression such as cancers and infectious diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridiantion to a DNA library, in analysis of genetic variation or in hybridiantion of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the cucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotter the hybridisation to identify or detect the sequence or specific metations of any gene, in mapping the 5, terminio of mutations of any gene, in mapping the 5, terminio of mutations of any gene, in mapping the 5, terminio of mutations of any gene, in mapping the 5, terminio of mutations of any gene, in mapping the 5, terminio of mutations of any gene, in mapping the 5, terminion of mutations of any gene, in mapping the 5, terminion of mapping the 5, terminion of mutations of any gene, in mapping the 5, terminion of mapping the 5, terminion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.

WO9213102-A1.

Bos taurus.

06-AUG-1992

Sequence of a microsatellite from clone TGLA86.

(revised)
(first entry)

25-MAR-2003 02-FEB-1993

AAQ34170;

bp with an (AC)15 and a (TC)15 oligomuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of preeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 a 0.5%; Score 18.4; DB 1; Length 20; illarity 95.0%; Pred. No. 6.7e+02; Conservative 0; Mismatches 1; Indels Sequence 20 BP; 0 A; 0 C; 10 G; 10 T; 0 U; 0 Other; 2318 TGTGTGTGTGTGTGCGTG 2337 Local Similarity nes 19; Conserv Query Match Matches à d primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a bovine microsatellite sequence obtd. by

conscienting a library of bovine MboI DNA fragments of between 250 and 500

constant an (APC)15 and a (TPC)15 oligonucleotide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites

conscient a penome is estimated at >100, 000. The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

construer of the microsatellite sequence waset to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program opriperIM). The microsatellites may be

microsatellity individuals, for parentage testing, and in the genetic

cused to identify individuals, for parentage testing, and in the genetic

mapping of economic trait loci, or genes involved the determinism of

conomically important traits esp. in cattle, to allow selective

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and whost microsatellites is summarised in the sequence information of for ca. 230 such bovine microsatellites is summarised in the sequence used to specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of connecting in microsatellite is a marker for the Weaver condition and the QTL trait of enhanced milk prodn. in Brown Swiss condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antitumoural phosphodiester oligonucleotide 19 with cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Oligo:nucleotide which binds to retroviral nucleocapsid protein with high affinity - used in targeted molecules, transduced cells and gene therapy vectors for treatment of retroviral infections such as those caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid binding, and for purification of retroviral NC proteins. In particular, the targeted molecules, the transduced cells and gene therapy vectors based on the oligonucleotides can be used for treatment and prevention of retroviral infections such as those caused by HIV
                                                                                                                                                                                                                                         This sequence represents an oligonucleotide which binds to a retroviral nucleocapsid (NC) protein with high affinity. The invention relates to a targeted molecule which binds to a retroviral nucleocapsid protein with high affinity and comprises the oligonucleotide and a fusion partner. Retroviral nucleocapsid proteins, such as NC and the Gag precursors, bind to specific nucleic acid sequences with high affinity. This binding is dependent upon the zinc fingers of the NC protein and has a strong are useful as molecular decoys for retroviral NC proteins, for making fusion proteins which inactivate retroviral NC proteins, in screening assays for detecting molecules which inactivate retroviral NC proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Displacement chromatography for purification of peptide samples by homogeneous application of sample components to chromatography bed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                   The present phosphodiesteric oligonucleotide is based on the generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-

(GcTo')c''-(GdTd')d''-(GeTe')e''-(GTTE')f''-(G-TG')g''-N', where: N and G'' = T or G, equal or different from each other; a' b', c', d', e', f', and g' = 0-10, equal or different from each other; a', b', c', d', e', f', and g' = 0-30, equal or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-10, equal or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-10, equal or different from each other; oligonucleotides of this generic sequence (see also AAT93811-27) are believed to selectively bind and sequence (see also AAT93811-27) are believed to selectively and growth of tumoural cell line. They have specific and selective cytocoxic activity against tumour cells, and can be used for treating tumours of the liquid type, in particular of lymphoblastic origin, and of solid type, in particular of lymphoblastic origin, and of solid type, in particular lymphomas. The present oligonucleotide is known, but no biological activity has been reported until the reported cytotoxic antitumour activity. (Updated on 25-WAR-2003 to correct PR field.)

ប្រក្រង់និ ઠ ò 셤 The present invention describes a method (I) for sample displacement chromatography separation. The method comprises applying a multicomponent sample along the bed by passing non-eluting mobile solvent phase over the bed, and recovering a desired component of the sample from at least portion of the bed by passing non-eluting mobile solvent phase over the bed, and recovering a desired component of the sample from at least portion of the bed. The sample components are applied in a non-homogeneous manner to bed. The sample components are applied in a non-homogeneous manner to and/or high affinity for the stationary phase material, respectively, and/or high affinity for the stationary phase material. The method sample components at significantly higher concentrations and recovery of sample components at significantly higher concentrations and recovery of sample components at significantly higher concentrations and recovery of sample components at significantly higher concentrations and separation, it involves minimal use of costly HPC solvents and fraction analysis, avoids the use of displacer solution during actual separation analysis, avoids the use of displacer solution during actual separation of analysis, avoids the use of displacer solution during actual separation of the purification of an oligonucleotide by sample displacement invention ö from the human melanocortin-1 receptor (MCIR) gene upstream controlling sequence. Also described is a method for detecting a substance affecting synthesis of melanin in which a host transformed by an expression vector, comprising a control active polynucleotide derived from MCIR, is cultured in the presence of a sample to be tested and a signal formed by the expression of said reporter gene is detected. The control-active polynucleotide is used for the detection of a substance affecting The present invention describes a control-active polynucleotide derived Human; melanocortin-1 receptor; MC1R; promoter; regulation; detection; melanin; ds. Gaps Upstream controlling sequence of melanocortin1 receptor and its ö Human MC1R gene related TATA box oligonucleotide SEQ ID NO:15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a control-active polynucleotide derived from the human melanocortin-1 receptor (MC1R) gene upstream controlling sequence. Also described is a method for detecting a substance affecting synthesis of melanin in which a host transformed by an expression vector, comprising a control active polynucleotide derived from MC1R, is cultured in the presence of a sample to be tested and a signal formed by the expression of said reporter gene is detected. The control-active polynucleotide is used for the detection of a substance affecting synthesis of melanin. The present sequence represents a human melanocortin-1 receptor gene TMTA box oligonucleotide, which is given in the exemplification of the present invention
eguences or metanin. The present sequence represents a human melanocortin-1 receptor gene TATA box oligonucleotide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; melanocortin-1 receptor; MC1R; promoter; regulation; detection;

```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tendemly repeated nucleotides core elements 2-6 nucleotides in length. Also included are a nucleic acid primer 2 included are a nucleic acid primer 2 includes in length. Also included are a nucleic acid primer 3 includes or fescue genomic DNA enriched for SSRs by preparing a clentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profilling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal species varieties by sessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                   Simple sequence repeat, plant, ds, SSR, ryegrass, fescue, tandem repeat, cereal profiling, grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   STATE SOUTH AUSTRALIA SOUTH AUSTRALIAN R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (UYSC-) UNIV SOUTHERN CROSS.

```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence copeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer cuitable for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and cidentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing contained for DNA profiling grass or cereal species varieties by assessing seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties, for testing the purity of grass or cereal species varieties and for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species

                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                     The invention relates to control of telomere length in a cell by modifying the physiological activity of the Mrell protein in the cell, by transformation of the cell with DNA encoding a foreign Mrell protein which may be modified in the C-terminal and/or nuclease domain. The method is useful in gene therapy of telomere length-related diseases such as melanoma, liver cancer, breast cancer, bladder cancer and brain cancer. The present sequence is that of a Mrell related probe of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, antiinflammatory, cytostatic, antisense gene therapy,

The present sequence is one of a number of antisense compounds of up to 30 nucleobases in langth that are capable of inhibiting the expression of phosphoenol pyruvate carboxykinase-cytosolic (PEPCK-cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics. They are commonly used as research genes. They are distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA oligomer #5.
```

```
The present sequence was used to demonstrate the ability of deoxynucleic S-Methythiourea (DNmt) compounds to form triplexes with DNA oligomers. An increase in the C content of the oligos resulted in a large decrease in binding. This experiment was performed as an example of a method for preparing oligonucleotides comprising a backbone of alkyl or alkoxy thiorea linkages. The method is useful for preparing oligonucleotides for use in antisense or antigene therapy, to inhibit production of proteins associated with genetic diseases, cardiovascular, inflammatory and neurocellular diseases, and for antiviral therapy, e.g. to treat numan immunodeficiency virus, human-cytomegalovirus, influenza and herpes infections. The compounds are also useful as diagnostic reagents to detect the presence or absence of the target DNA or RNA sequences to which they specifically bind, and by antagonising the normal biological activity of a target protein, they can be used in the manipulation of tissue e.g. The method provides an efficient and rayor and in ex vivo tissue cultures. The method provides an S-methylthiourea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method of treating systemic lupus erythematosus and lupus nephritis, involving administering a conjugate comprising a non-immunogenic valency platform molecule and 2 double stranded DNA epitopes which specifically bind to dsDNA-binding antibodies. Affinity of the epitopes for the antibody is used as a basis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating systemic lupus erythematosus in individual comprises e.g. administering conjugate comprising non-immunogenic valency platform molecule and double stranded DNA epitopes which specifically bind to antibody from individual.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are gluctronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                                      Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human uridine diphosphate glucuronosyltransferase gene polymorphism #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, polymorphism, TA repeat; ds; UGT; thymidine-adenine repeat; uridine diphosphate glucuronosyltransferase gene promoter; UGT1A1; drug dosage optimisation; xenobiotic sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.5%; Score 18.4; DB 1; Length 20; 35.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human uridine diphosphate glucuronosyltransferase gene polymorphism #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                          The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                Gaps

The method is used for immobilising molecules on a support using cycloaddition reactions such as the Diels-Alder reaction. The method shows better chemoselectivity, functional groups do not need to be protected and it is highly efficient for immobilising molecules compared to other methods. The present sequence is that of an oligonucleotide, useful to the invention

The present invention relates to a method for the synthesis of a polynucleotide which involves coupling a second nucleoside to a first nucleoside through a phosphite linkage, where the second nucleoside has a non-carbonate protecting group protecting a hydroxyl, and exposing the product to a composition which concurrently oxidizes the phosphite formed to a phosphate and deprotects the protected hydroxyl of the second nucleoside. The method is useful for synthesizing the polynucleotides, for carrying out either 3' to 5' or 5' to 3' synthesis and for fabricating an addressable array of polynucleotides on a substrate. The

The invention relates to a method for immobilising a molecule on a support comparing reacting a derivatised molecule with a derivatised support capable of reacting with the molecule via a cycloaddition reaction. The method is used for immobilising molecules on a support using cycloaddition reactions such as the Diels-Alder reaction. The method shows better chemoselectivity, functional groups do not need to be protected and it is highly efficient for immobilising molecules compared to other methods. The present sequence is that of an oligonucleotide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New method for immobilizing a molecule on a support comprises reacting derivatized molecule with a derivatized support via a cycloaddition reaction, shows high selectivity and efficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid detection; hybridisation; microarray; thermistor; microcalorimetry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    / Match 0.5%; Score 18.4; DB 1; Length 20; Local Similarity 95.0%; Pred. The present sequence is that of a (CA)10 oligonucleotide used to CC illustrate the method of the invention. The invention provides methods illustrate the method of the invention. The invention provides methods CC for detecting specific binding interactions through measurang the heat of binding pairs interact with cach other. The invention also provides methods to detect analytes in a cc solution through measurement of the heat of binding or reaction generated from the interaction of the analytes with binding or reaction generated control devices are provided that consist of spatially addressable control devices are provided that consist of spatially addressable cr arrays of thermistors, which are useful in the multiparallel thermal cr analysis of samples. The methods and devices are particularly in the analysis of mucleic acid, repectablly DNA/DNA, DNA/RNA, DNA/RNA (linear uncleic acid), DNA/SNA (short interfering RNA) and DNA/RNA (pptide comprises part of an enzymatic amplification reaction, especially PCR or primer extension reaction. The detection device provides a real time, comparises part of an enzymatic amplification reaction, using the binding or reaction partner. An example from the invention, using the present oligonucleotide, showed that the thermal detection technique is comparisors.
                                                                                                                                                                                                                                                                                     Detection device useful for detecting binding between members of specific binding pair, and for multiparallel thermal analysis of samples, has an array of addressable thermistors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                             The present sequence is that of a (TG)10 oligonuclectide used to illustrate the method of the invention. The invention provides methods for detecting specific binding interactions through measuring the heat of binding generated when members of specific binding pairs interact with each other. The invention also provides methods to detect analytes in a solution through measurement of the heat of binding or reaction generated from the interaction of the analytes with binding or reaction generated arrays of thermistors, which are useful in the multiparallel thermal analysis of samples. The methods and devices are particularly in the analysis of samples. The methods and devices are particularly in the analysis of nucleic acids, especially DNA/DNA, DNA/RNA, DNA/RNA, DNA/RNA, DNA/RNA, DNA/RNA, DNA/RNA, DNA/RNA, DNA/RNA, DSA/RNA (special conditions and its binding partner of nucleic acid). The binding between the analyte and its binding or reaction. The detection device provides a real time, digital profile of the binding or reaction between the analyte and its binding or reaction device provides a real time, digital profile of the binding or reaction between the invention, using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                   Detection device useful for detecting binding between members of specific binding pair, and for multiparallel thermal analysis of samples, has an array of addressable thermistors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Systemic lupus erythematosus; SLB; impaired renal function; LJP 394 conjugate; dermatological; immunosuppressive; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

Novel polynucleotide useful for detecting single nucleotide polymorphisms

```
The present invention relates to a method of treating systemic lupus erythematosus (SLB) in an individual. The method comprises selecting an individual having SLE, significantly impaired renal function, and antibodies with high affinity to a polymuclectide epitope by administering a conjugate comprising non-immunogenic valency platform molecules and two or more double stranded DNA (dsDNA) epitopes that are polymuclectides. Also disclosed is a kit comprising the conjugate, LJP 394. The conjugate is administered in an amount effective to reduce incidence of renal flares in the individual. A medication chosen from corticosteroids and cyclophosphamide is also administered to the individual. The conjugate is administered in an amount effective to reduce content of a corticosteroid or cyclophosphamide selective to reduce the amount of a corticosteroid or cyclophosphamide administered to the individual. The present sequence represents a polynucleotide (dsDNA)
                                                                                                                                                                                                                                                                              Treating systemic lupus erythematosus comprises selecting an individual having significantly impaired renal function and administering conjugate having non-immunogenic valency platform molecule and double stranded DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 0 A; 0 C; 10 G; 10 T; 0 U; 0 Other;

                                                                                        The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1200 fully defined sequences as given in specification, a labelling probe containing the SNP containing oligo. The isolated human a microarray equipped with the SNP containing oligo. The isolated human populymorphisms in human gene. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective polymorphisms in a human gene. This polymorleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo.                  polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g.,
                                                                                                                                                                                                                                                           Gaps
the invention is useful for detecting the single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "phosphorothioate linkages and all cytidine

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mEGES-1). The human megES-1 gene is located on chromosome 9, more specifically to qqq4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding meGES-1, which specifically hybridise with the nucleic acid encoding inhibite its expression; (2) a method of inhibiting the expression of meGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cyrostatic, antialabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, nootropic, antistifica, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mEGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mFCES-1; mFGES-1 inhibitor; microsomal prostaglandin E2 synthase; mFCES-1; mFGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antidinflammatory; neuroprotective; antiditlammatory; neuroprotective; osotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; se.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or repertusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9g34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The thuman mPGES-1 gene is located on chromosome 9, more specifically to operate the present invention also describes: (1) antisense compounds, carbining a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding carbinist its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal carbinase oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiovascular activities, and can ophthalmological, immunomodulatory and cardiovascular activities, and can obe used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, alternation infinity of the composition is a composition in infinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

The human mmGES-1 gene is located on chromosome 9, more specifically to oga4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding mpGES-1, in cells or tissues; and (3) a method of inhibiting the expression of meCES-1 in cells or tissues; and antisense compounds have cytostatic, articlabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiant, activities, and can continue as mpGES-1 inhibitors and in gene therapy. The antisense compound to be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or all antisense can be used with meGES-1 e.g., infilameting a disease or condition associated with meGES-1 e.g., infilameting a disease or condition associated with meGES-1 e.g., infilameting a disease or condition associated with meGES-1 e.g., infilameting a disease or condition associated with meGES-1 e.g., infilameting a disease or condition associated with meGES-1 e.g., infilameting a disease or condition associated with meCES-1 e.g., infilameting a disease or condition activities and a

having a sequence comprising 8-30 bp targeted to a nucleic acid encoding medES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiammatory, neuroprotective, notropic, antidiammatory, immunomodulatory and cardiavascular activities, and can ophthalmological, immunomodulatory and extitovative activities, and can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e-g., inflammation, Alzheimer's

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to gaz4.3. The present invention also describes: (1) antisense compounds, or a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding mPGES-1, in cells or tissues; and of inhibiting the expression of mPGES-1 in cells or tissues, and nucleic acid mPGES-1 and missense or condition associated with mPGES-1. MPGES-1 chimeric antidifiammatory, neuroprotective, nouroprotective, antidifiammatory, neuroprotective, notropic, antistrictic, vasotropic, antidifiammatory, neuroprotective, notropic, antistrictic, vasotropic, be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., infilammation, inhum, or condition associated with mPGES-1 e.g., infilammation, inhum, or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1, in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; nucroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; notroprotective; ophthalmological;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human mPGES-1 chimeric antisense oligonucleotide SEQ ID NO:613

```
can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mGGES-1). The human mGGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.giflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGE5-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9d34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibite its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, vasotropic, antidifammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can
